

Warning:

Special Report!

(This is information that no other shops are telling you)

Why many people are incurring very expensive repairs as a result of high gas prices and how to avoid them.

Due to the often ups and downs (and the high price) of the gas prices many people are not filling up the gas tanks any more or are **letting the level get very low**. They are doing this for several reasons; one reason is they are waiting as long as they can after a big increase to see if the price will go back down a few cents as it often does. Another reason is just plain and simple **how much it costs!**

Whatever the reason, the very **expensive consequence** is the same. When you operate your vehicle on a regular basis with the fuel level **below a ¼ tank** you may cause **damage to your fuel pump**, in many cases causing it to **fail**, this is even truer **in the summer time!**

Surprising information for most people

Most vehicles today have their fuel pumps located inside the tank, one very important aspect to that, believe it or not, is that it is intended for the **fuel in the tank to help keep the pump cool during operation**. When the level gets to a certain point and the fuel is not cooling it the **pump overheats** and over time this will **cause it to fail**. We see this often in cars that are driven by teens because many times they don't have enough money to keep the fuel level up in their cars.

We usually see a jump in **fuel pump failures** when the price of **gas goes higher**. Replacing many of the fuel pumps today are **very expensive**. It is not uncommon to see prices that range between **\$500-\$1000** and higher on some models.

Here's how you can avoid paying us that large sum of money!

Although we will gladly take care of this repair should you need it, we would like to **help you avoid expensive repairs** when you can. There are many repairs on your vehicle that you cannot avoid, this is one that **you can do something about**. All you really need to do is **maintain ¼ tank of gas or more** in your vehicle to make sure that there is enough to keep the pump cool, **resist the temptation** to wait out the price increase and **save a lot in the long run**.

Because **you are on of our valued clients** we want to help you avoid this potential pitfall. If you have **any questions** about this please [give us a call at 425-882-0630](tel:425-882-0630).
